

Become a secret agent and pass hidden messages. Use spy science to reveal them.

How does it work?

Fruit juices, like lemon juice, contain compounds of carbon – a chemical element found in all living things. Many carbon compounds are colourless at room temperature. When you leave your message to dry, the water dries out, leaving the remaining parts on the paper. These substances break down when heated, releasing the carbon. Then, carbon combines with oxygen in the air and changes colour, revealing the secret words or pictures.

DID YOU KNOW? Gecond World War,

In the Second World War, the British secret services trained their agents in how to make invisible inks from common materials.

If you haven't got any
lemon juice in the house, you
can try this experiment
with milk instead. Milk
contains a kind of
sugar called lactose.
When you add heat,
the sugar in the milk
caramelises, turning
brown and exposing the
hidden message.

What you need

- Lemon juice
- Small bowl
- Paintbrush
- White paper
- Helpful adult

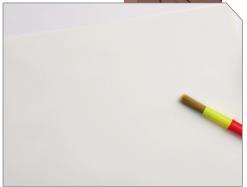

Iron

Pour a small amount of lemon juice into a bowl.

Dip the paintbrush into the lemon juice.

Write your message on a piece of white paper then leave to dry. The writing should disappear.

To reveal the message, ask an adult to iron the paper. Use a high temperature and no steam.

Keep moving the iron around and see if you can spot a colour change taking place.

Now that your secret message is fully revealed, try the activity with other liquids.
